

CROP REPORT

Season start date:

May 1st 2021

Period covered:

From May 1st to 28th, 2021

#1 - Planting Progress

WEATHER DATA (PERIOD / TOTAL SEASON)

Location	Rain	Average temperature	CHU
Eastern Ontario 2021	13,5 mm / 1000 mm	20,4 °C	228 to date

RAIN & DROUGHT

Moisture in the soil is adequate for the moment. With the ideal soil preparation conditions, this gave growers an early start to planting this season. We got a good stretch without rain and planting progressed at a very quick pace to the point that by May 28th, I believe that 99% of the soybeans were planted.

13,5 mm

AVERAGE TEMPERATURE

From May 10th, the ambient temperatures were above average levels until the week of May 25th. Soybean's germination is looking very good at this time.

20,4 °C

WEATHER FX ON PLANTS

-

Because of the ideal soil conditions, I expect very good to good even germination and populations throughout Eastern Ontario. One of the best starts for a very large geographic area and with a mixture of different soil types from hard clays to sands. Even the untilled fields were planted in record time this year again!!!

Mildly negative

CROP LOCATION BY VARIETY

DEVELOPMENT STAGE

CROP MANAGEMENT-

Most fields have already received a herbicide application pre-emergent but very little precipitations make it risky that a second pass will be required to keep fields clean this year. Currently most fields are at the VE to VC stage. Some fields are getting to V1 in Eastern Ontario.

ORGANIC CROP-

Most organic fields were planted around May 15th to May 25th in good soil conditions.
