

CROP REPORT

Season start date: April 25th 2024

Period covered:

LOCATION	RAIN	AVERAGE TEMPERATURE	CHU
Eastern Quebec 2023	115.8mm / 1157 mm	26 °C / 14 °C	1008 / 3300
Eastern Quebec 2024	247.9 mm / 689 mm	24.7 °C / 15.7 °C	973 / 3300
RAIN AND DROUGHT	AVERAGE TEMPERATURE	WEATHER FX ON PLANTS	
310 mm	20 °C	16	

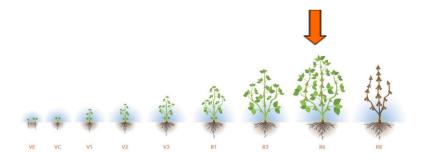

Later planting season caused irregular emergence in some places. However, soybeans seem to have generally recovered from this delay.

In the fields, soybeans are now covering the rows, which is good news. We also note that the internodes are shorter than in 2023, which should lead to better plant standing when they fill the pods.

The first pods appeared at the bottom of the plants around mid-July.

Aphids were also present in the field but will not have an impact on soybean harvests since producers took the necessary actions when they were affected. The presence of white mold still needs to be monitored since it is usually caused by hot and humid weather conditions.

Hence, everything seems to be in place for soybean plants to develop properly and make a good harvest.
